# SELECTION & ORDERING INFORMATION, INCH SERIES

## Selection Procedure

- Determine the output speed and torque required for your application. The maximum recommended output speed is 3000 rpm for 1:1 units, and 1500 rpm for 2:1 units. 2:1 units are NOT recommended for use as speed increasers.
- Select an application service factor from the chart to the right. Multiply your torque by the selected service factor. If you are unsure of the factor to be used, please consult us.
- Using the chart below, find your output speed on the left. If your speed is not shown, use the next highest speed. Depending on the ratio you need (1:1 or 2:1), follow the chart across until you find a torque value that is larger than your corrected torque value.
- The Unit Size you need will be at the top of that column. There are 5 sizes available. At the bottom of the column is a list of the various models available under the selected size. Select the model number; based on the gear ratio and the number of shafts you need (2 or 3). When ordering, use the model number you selected, along with the ratio desired.
- Check the applied radial and thrust loads on the unit compared with loads in the chart at the bottom of the page. If the applied loads are larger than the chart values, a larger unit must be selected.
- Refer back to pages 4 and 5 for dimensional information on the model you selected.

## SERVICE FACTORS

OPERATION CONDITIONS	UNIFORM LOAD		MODERATE SHOCK	
	3	0.7	0.9	1
SERVICE (hours/day)	8	0.9	1	1.3
	12	1	1.3	1.8
	24	1.3	1.8	

$$T \text{ (in.lb)} = 63,000 \times \text{HP} / \text{RPM}$$

$$\text{HP} = T \times \text{RPM} / 63,000$$

\* Unit ratings are: Output Torque in in.lb and Output Power in HP.

## Selection Example

An application to connect a drive-shaft to a fan-shaft at a right-angle. Gearbox ratio to be 1:1. Input and output connections are with timing belt pulleys at 1000 rpm. Transmitted power is 1.34 HP. Operating conditions are moderate shock, 12 hours/day.

- Output speed is 1000 rpm. Operating torque =  $63,000 \times 1.34 \text{ HP} / 1000 \text{ rpm} = 84.4 \text{ in.lb}$ .
- Service factor from chart (12 hours/day, moderate shock) – SF = 1.3. Corrected torque =  $84.4 \times 1.3 = 109.7 \text{ in.lb}$ .
- From ratings chart (output speed = 1000 rpm), unit torque = 193 in.lb (>109.7 in.lb) – Size 3 1:1.
- The model selected is: R3330 for two-way or R3350 for three-way.
- The applied radial loads are calculated to be 74 lb. on each shaft (<100 lb.) which is allowable.
- On pages 4 and 5, the dimensions are checked to confirm available space for model selected.
